HIV
Retrovirus - infects the body's immune system (CD4 cell) - HIV cannot reproduce on its own - Instead, the virus attaches itself to a T-helper cell and fuses with it.

CD4+
T lymphocytes help coordinate the immune response by stimulating other immune cells, such as macrophages, B lymphocytes (B cells), and CD8 T lymphocytes (CD8 cells), to fight infection.

Regulatory T cells (Tregs)
specialized subpopulation of T cells that act to suppress immune response, thereby maintaining homeostasis and self-tolerance.

CD8+ T cells
cytotoxic - kill virus-infected cells, as well as cancer cells. They use cytokines, to recruit other types of cells when mounting an immune response.

cART
combination antiretroviral therapy - HIV infections under control.
